Abstract

This is our abstract.

Contents

List of Figures

List of Tables

Chapter 1

Introduction

1.1 What should go into this chapter?

- Suggested length is 1 – 1.5 pages
- Set the scene for the report by explaining its purpose and significance.
- Provide an overview of the two problems tackled in the report.
- Briefly introduce the selected solutions and how they fit within the project context.
- Explain the structure of the report to guide the reader.

1.2 Example of text

This is an example of a citation [**?**, **?**] and the results can be seen in Figure **??**, the puppy is cute. As ingle citation would be [**?**].

As seen on page **??**, and that's it.

This is how to describe the structure of your report. We structure the remainder of this report as follows: In the next chapter **??**, we discuss the background of our project. In chapter **??**, we present and discuss our process-related problem, our selected solution, how we implemented it and the results we achieved ... We reflect in our semester project work and the solutions we implemented it in chapter ...

Figure 1.1: A nice puppy (resized, tilted and cropped).

Chapter 2

Project Background

These are just example of how to set sections within a chapter. You don't have to have section or subsection in this chapter.

2.1 Project Background

2.2 Project Scope

2.2.1 Outline

2.3 What should go into this chapter?

- Suggested length is 1 – 1.5 pages
- Provide a brief overview of the semester project.
- Outline the scope of the project, its key deliverables, and expected outcomes.
- Explain how the problems addressed in this report relate to the semester project.

Chapter 3

Process-related problem

Suggested length is 7 – 10 pages

3.1 How to set tables in LaTeX?

Now lets add a table that looks good. For the relevant data please see Table **??**.

Table 3.1: This is a very long table caption, with lots of information and interesting facts.

Group text add		
Property	Units	Value
Young's modulus	MPa	2.10×10^5
Density	kg/m^3	7,830
Ultimate stress	MPa	235.0
Young's modulus	MPa	2.10×10^5
Density	kg/m^3	7,830
Ultimate stress	MPa	235.0
Colour	–	Blue

3.2 Problem Statement

- Provide background information on the selected process-related problem.
- Justify why addressing this problem is important for your team and in general, e.g., efficiency, project success, and future professional work and development.
- Formulate a clear and well-defined problem statement.

3.3 Selected Solution

- Introduce the Scrum practice(s) (or the whole Scrum framework) chosen to address the problem.

- Justify why this practice(s) or the Scrum framework was selected and how it aligns with solving the issue.
- Support the discussion with references to Scrum literature or Agile best practices. You could also support your claims from your own experiences, e.g., past semester projects.

3.4 Implementation

- Describe how the selected Scrum practice(s) were applied in the project.
- Provide empirical evidence (e.g., Scrum board snapshots, Sprint Review sessions transcripts, etc.).
- Explain how the team adapted the approach to fit their project context.

3.5 Results

- Analyze to what extent the solution alleviated the problem.
- Provide qualitative and/or quantitative evidence (e.g., sprint velocity improvements, better team coordination).
- Discuss any challenges encountered and how they were mitigated.

Chapter 4

Software Engineering-Related Problem

Follow the same structure as the Process-Related Problem section but applied to the SE-related problem. Suggested length is 7 – 10 pages

4.1 Problem Statement

- Introduce and justify the selected SE-related problem.
- Explain how it impacts software development of an aspect(s) of the software product, e.g., software quality, maintainability, performance, etc.

4.2 Selected Solution

- Identify the Software Engineering (SE) practice, technique, or principle chosen to address the issue.
- This must be based on a SWEBOK Knowledge Area (KA) or a course topic (e.g., TDD, DevOps, Software Quality, Requirements Engineering).
- Justify why this solution is a good fit for the problem.

4.3 Implementation

- Describe how the solution was applied in the project.
- Provide empirical evidence (e.g., improved code quality (code snippets before and after), test results, UML diagrams).
- Explain how the team adapted and iterated on the solution.

4.4 Results

- Evaluate to what extent the solution mitigated, improved, or addressed the problem.

- Provide evidence of success achieved (if any) and challenges faced.
- Discuss any potential improvements if the solution were to be used again.

Chapter 5

Reflection

This is a group-level reflection in the journey you took to implement solutions for process and SE-related problems. It is recommended to not exceed 3 pages.

5.1 What should go into this chapter?

- Overall Team Reflection:
  - Reflect on how effectively the team addressed both problems.
  - Discuss team dynamics, challenges, and key takeaways.
  - Identify lessons learned about process improvement and SE best practices.
- Lessons for Future Projects:
  - Discuss what strategies or methods the team would retain, improve, or discard.
  - Reflect on how these experiences align with professional software engineering practices.

Chapter 6

Individual Reflections

This is individual-level reflections. Must be one page max per student.

6.1 What should go into this chapter?

- Topics to cover, but not limited to:
  - Experience working in an Agile environment.
  - Alignment (or misalignment) of Agile values with their own mindset and personal values.
  - Key lessons learned and areas for improvement.
  - How they plan to become a more effective Agile team member in the future.

6.2 Student 1

6.3 Student 2

6.4 Student 3

6.5 Student 4

Chapter 7

Conclusion

We conclude in this section and we do it in half a page.

Appendix A

Appendix A

A.1 First section

A.2 Second section

A.3 Third section
